

Notification System — Setup Steps Needed From G3

The in-app bell already works with no setup. This covers what's needed to also turn on Slack and email delivery, with screenshots of exactly where each thing goes.

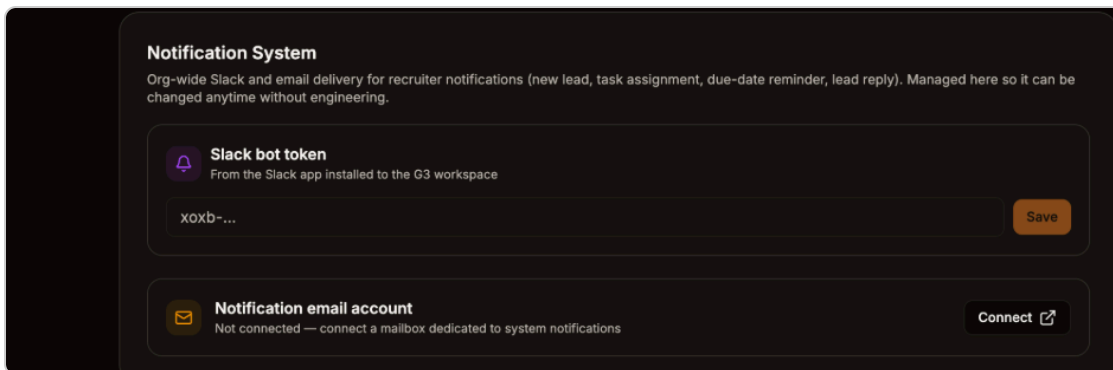

SLACK

Private DMs to each recruiter — no channel involved

Part 1 — One-time setup *(whoever has Slack admin rights, ~5 min)*

1. Go to api.slack.com/apps and click "Create App"
2. Give it permission to send **direct messages**
3. Click "**Install to Workspace**" — this adds it into G3's existing Slack, the same as installing any other plugin. No new workspace, no channel created.
4. Slack generates a **bot token** (starts with xoxb-) — the owner logs into Project Beacon, clicks **Settings** in the left sidebar (gear icon), scrolls to the **Notification System** section, and pastes it into the **Slack bot token** field, then clicks **Save** (see screenshot below)

After this, the bot just sits quietly in the background — recruiters will see a DM appear from it only when something needs their attention.

Owner Settings → **Notification System**. Paste the Slack bot token into the top field (labeled "Slack bot token") and click **Save**. The bottom card ("Notification email account") is for the email setup below.

Part 2 — Each recruiter *(self-serve, ~30 seconds each)*

1. Open Slack, click your own profile picture/name
2. Click the "..." (more) menu → "**Copy member ID**"
3. Log into **Project Beacon**, click **Settings** in the left sidebar (gear icon)
4. Scroll to **Notification Preferences**, paste the copied code into the **Slack Member ID** field at the bottom, and click **Save** (see screenshot below)

Notification Preferences

The in-app bell is always on for new leads, task assignments, due-date reminders, and escalations. Turn on email or Slack for any type below.

Type	Bell	Email	Slack
New lead application			
Task assignment			
Project due-date reminder			
Lead response (per-lead bell, set on each lead's row)	—		
Escalated items			

Slack Member ID
 Copy your member ID from your Slack profile and paste it here to receive Slack notifications.

Save

Recruiter Settings → **Notification Preferences**. The table controls which types come by email/Slack (bell is always on). The **Slack Member ID** field at the bottom is where each recruiter pastes their own copied ID.

Cost: none — standard Slack workspace functionality.

EMAIL — VIA UNIPILE

Reuses the same "connect account" flow already in place

Setup (one-time, done by the owner — no engineering involved)

- Owner logs into Project Beacon, opens **Settings** → **Notification System** (same section as the Slack token above)
- Decide on one mailbox** to use for system notifications — e.g. *notifications@global3.com*
- In the **Notification email account** card, click **Connect** — this opens the exact same Unipile connection popup recruiters already use to link their own outreach accounts
- Sign in to that mailbox in the popup — once linked, it's automatically set as the notification account. Nothing to copy/paste, nothing to send to engineering

No separate webhook needed — sending uses a direct API call, and any account-connection status updates flow through the webhook that's already running for the outreach accounts.

Cost: free if this stays under our current 10-connected-account limit; roughly \$5.50/month if we're already at that limit.
