

Rubric → Database Mapping

How each metric on the recruiter performance rubric is defined, calculated, and stored — tracing every number on the evaluation dashboard back to a Prisma table and column.

The live rubric (`client/src/lib/evaluation.ts`) scores recruiters on **9 metrics** across **3 groups**. Two groups are weighted into the overall score; the third is tracked as signal only. Today the app computes these from seeded mock data — the formulas below are what each metric computes *against the mock*, and the query each will run once it reads from the real tables in `Project_Beacon_DB_schema_V2.prisma`.

80% of score

Activity & Effort

Outreach volume, proactive sourcing, time-to-first-touch — how much work happens and how fast it starts.

20% of score

Ownership & Follow-through

Progression rate, reason-logged rate — whether contacted leads move, and whether closures are explained.

0% · watched

Outcome Metrics

Onboard ratio, cold revivals, manual interviews & conversions — displayed, not weighted into the score.

Scoring formula

Every scored metric is normalized to a 0–1 *ratio* against its `goodBand`, then multiplied by its rubric weight to get a point contribution. The four contributions sum to the overall score.

NORMALIZATION RATIO

higher-is-better: `ratio = min(1, current / goodBand)` lower-is-better: `ratio = max(0, 1 - max(0, current - goodBand) / max(1, goodBand × 2))`

POINT CONTRIBUTION — PER METRIC

`contribution = round(ratio × weight) // stored as recruiter_metric_snapshots.normalized`

OVERALL SCORE

`overallScore = clamp( Σ contribution[scored metrics], min: 40, max: 100 ) //`
`recruiter_score_snapshots.overall_score`

Status & band thresholds

● Signal only — no target set ● On track — meets target ● Watch — within 20–50% of target ● Off track — beyond that band

SCORE ≥	BAND	MEANING
85	Strong	Minimal oversight needed
70	Solid	Meeting expectations
55	Coaching	Needs a coaching conversation, with a named area
0	Review	Requires review this week, not next cycle

METRIC	DEFINITION	DATABASE QUERY	CONFIG
Outreach volume	Outbound messages sent this month.	COUNT(interaction_events) WHERE recruiter_id=:id AND direction='OUTBOUND' AND occurred_at IN period	30% · count · ↑ goodBand 420
Proactive sourcing	Self-found candidates added, beyond assigned leads.	COUNT(leads) WHERE created_by_recruiter_id=:id AND is_self_sourced=true AND created_at IN period	30% · count · ↑ goodBand 34
Time-to-first-touch	Days between lead assignment and first outbound message.	AVG(MIN(interaction_events.occurred_at WHERE direction='OUTBOUND', lead_id=leads.id) - leads.assigned_at) for leads WHERE assigned_recruiter_id=:id, assigned_at IN period	20% · days · ↓ target 2 · goodBand 1
Progression rate	% of contacted leads that advance ≥1 stage.	COUNT(contacted leads WITH stage_history row AFTER first contact) / COUNT(contacted leads) × 100 — contacted = leads with ≥1 outbound interaction_event; owner = assigned_recruiter_id	10% · pct · ↑ target 60 · goodBand 80
Reason-logged rate	% of own Cold/DNC leads with a reason on file.	COUNT(leads WHERE (stage='COLD' OR 'DNC' IN flags) AND (closure_reason IS NOT NULL OR stage_history.reason IS NOT NULL OR lead_flag_events.reason IS NOT NULL)) / COUNT(same, any reason state) × 100	10% · pct · ↑ target 90 · goodBand 100
Onboard vs. queue (signal)	Onboarded candidates over total assigned.	COUNT(leads WHERE stage='ONBOARDED' AND assigned_recruiter_id=:id) / COUNT(leads WHERE assigned_recruiter_id=:id) × 100	0% · pct · ↑ no target
Cold lead conversion (signal)	Cold leads revived into an active stage this month.	COUNT(stage_history WHERE from_stage='COLD' AND to_stage≠'COLD' AND changed_by_recruiter_id=:id AND changed_at IN period)	0% · count · ↑ goodBand 18
Manual interviews (signal)	Recruiter-led interview sessions logged outside automation.	COUNT(manual_activity_logs WHERE type='INTERVIEW' AND recruiter_id=:id AND scheduled_at IN period)	0% · count · ↑ goodBand 15
Manual conversion (signal)	Conversions attributed to manual recruiter engagement.	COUNT(manual_activity_logs WHERE type='CALL' AND recruiter_id=:id AND outcome indicates conversion AND scheduled_at IN period)	0% · count · ↑ goodBand 10

Open item: `manual_activity_logs.outcome` is stored as free text with no defined "converted" vocabulary (schema note: *"'Converted' undefined — store raw, no rate logic"*). Manual conversion needs a business decision on which outcome strings count before this query can run for real.

Where it's stored

Config (weight/target/goodBand/direction) lives separately from computed results, so scoring can be re-tuned without touching history.

Note on scope: the schema's `KpiConfig` comment block lists 14 historical metric keys (adding `sla_adherence`, `backlog_aging`, `closure_rate`, `interview_conversion`, `followup_persistence`) and 5 groups — that reflects an earlier draft of the rubric. The live `evaluation.ts` and dashboard ship only the **9 metrics / 3 groups** mapped above; this document follows what's actually running.
